Here we run a complete RNASeq analysis from counts to pathways and biological insight...

We need to remove the odd first length col from countData

```
countData <- as.matrix(countData[,-1])

```

To confirm that all the column names from the countData match the rows of the metadata

```
all(colnames(countData) == metaData$id)
```

[1] TRUE

Now we need to remove all the zeros from the countData

```
countData = countData[(rowSums(countData) >0), ]

Performed pathway analysis online go to the Reactome website

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

The pathway with the most significant "Entities p-value" is the Cell Cycle (mitosis), which matches the top match on the list produced from the KEGG results. The Reactome database includes information about biological molecules and thier relation to pathways/processes, the KEGG database gives information about gene products and how/where they interact with each other in particular pathways.
