ENSG00000000938	0	0	0		

nrow(counts)

[1] 38694

The higher values of "count" indicates a higher level of gene expression (more transcripts are mapping to that region of the gene)

head(metadata)

```
id dex celltype geo_id
1 SRR1039508 control N61311 GSM1275862
2 SRR1039509 treated N61311 GSM1275863
3 SRR1039512 control N052611 GSM1275866
4 SRR1039513 treated N052611 GSM1275867
5 SRR1039516 control N080611 GSM1275870
6 SRR1039517 treated N080611 GSM1275871
```

sum(metadata\$dex=="control")

[1] 4

Q1. How many genes are in this dataset?

There are 38694 genes in this dataset.

Q2. How many 'control' cell lines do we have?

There are 4 'control' cells lines.

Check on match of metadata and coldata

```
colnames(counts)

[1] "SRR1039508" "SRR1039509" "SRR1039512" "SRR1039513" "SRR1039516" [6] "SRR1039517" "SRR1039520" "SRR1039521"

metadata$id

[1] "SRR1039508" "SRR1039509" "SRR1039512" "SRR1039513" "SRR1039516" [6] "SRR1039517" "SRR1039520" "SRR1039521"
```

[1] TRUE TRUE TRUE TRUE TRUE TRUE TRUE

colnames(counts) == metadata\$id

If you want to know that all the elements of a vecrtor are true we can use the all() function

```
all(colnames(counts) == metadata$id)
```

[1] TRUE

Examine Data

We are trying to compared one value from the control, to one value for the treated, this is used as a summary of the data. To do this, we take the average for each gene (each row) for all "control" columns.

We are extracting the control data from the metadata table, then select for the count data that corresponds by using the control as a column selection.

```
control.inds <- metadata$dex == "control"
control.counts <- counts[,control.inds]</pre>
```

Now I want to find the mean count value per gene using the apply() function .

1 gives a value per gene, 2 gives a value per experiment

```
control.mean <- (apply(control.counts, 1, mean))</pre>
```

Now we do the same thing for the "treated" data

```
treated.inds <- metadata$dex == "treated"
treated.counts <- counts[,treated.inds]

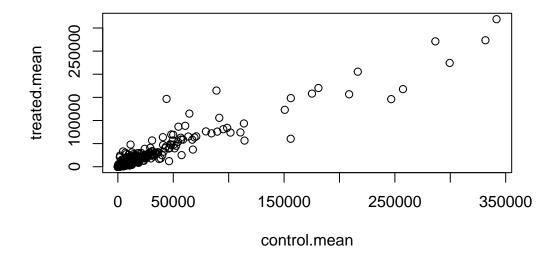

treated.mean <- apply(treated.counts, 1, mean)</pre>
```

Put these two mean vectors together for safe keeping for each of book-keeping

```
meancounts <- data.frame(control.mean, treated.mean)
head(meancounts)</pre>
```

	control.mean	treated.mean
ENSG0000000003	900.75	658.00
ENSG0000000005	0.00	0.00
ENSG0000000419	520.50	546.00
ENSG0000000457	339.75	316.50
ENSG0000000460	97.25	78.75
ENSG00000000938	0.75	0.00

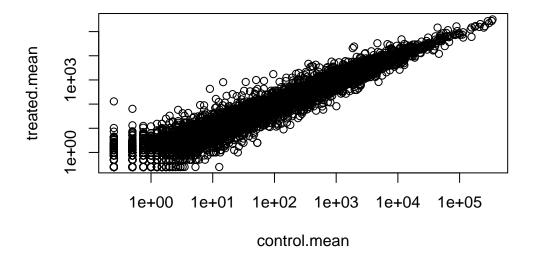

plot(meancounts)

```
plot(meancounts, log="xy")
```

Warning in xy.coords(x, y, xlabel, ylabel, log): 15032 x values <= 0 omitted from logarithmic plot

Warning in xy.coords(x, y, xlabel, ylabel, log): 15281 y values <= 0 omitted from logarithmic plot

log2() take the log of the input with base = 2. Using the log function is helpful for seeing which genes have BIG changes, whether it's positive or negative.

```
log2(20/10)
[1] 1
log2(10/20)
```

[1] -1

We often work in log2 units, because they have a more intuitive interpretation.

]We are going to add another column to meancounts, LOG2FC or log2 fold change of treated/control values and add it to our data frame. This will output a pos or neg value depends on the degree of change between treated and control gene expression.

```
meancounts$log2fc <- log2(meancounts$treated.mean / meancounts$control.mean)
head(meancounts)</pre>
```

	${\tt control.mean}$	${\tt treated.mean}$	log2fc
ENSG0000000003	900.75	658.00	-0.45303916
ENSG0000000005	0.00	0.00	NaN
ENSG00000000419	520.50	546.00	0.06900279
ENSG00000000457	339.75	316.50	-0.10226805
ENSG00000000460	97.25	78.75	-0.30441833
ENSG00000000938	0.75	0.00	-Inf

We need to remove the log2fc outputs that don't make sense (NaN or -Inf); these are there because there is a 0 involved in the log calculation. It is common practice to filter the zeroes out before we continue with analysis.

The variable mycounts excludes all the rows with zeros

```
to.keep.inds <- rowSums(meancounts[,1:2] == 0) == 0
mycounts <- meancounts[to.keep.inds, ]
head(mycounts)</pre>
```

	${\tt control.mean}$	${\tt treated.mean}$	log2fc
ENSG00000000003	900.75	658.00	-0.45303916
ENSG00000000419	520.50	546.00	0.06900279
ENSG00000000457	339.75	316.50	-0.10226805
ENSG00000000460	97.25	78.75	-0.30441833
ENSG00000000971	5219.00	6687.50	0.35769358
ENSG0000001036	2327.00	1785.75	-0.38194109

Q. How many genes do we have left after zero count filtering?

```
nrow(mycounts)
```

[1] 21817

A common threshold for calling a gene "up" is a log2fold change of +2 or -2 (quadrupleing)

Q. How many "up" regulated genes do we have?

```
sum(mycounts$log2fc >= +2)
```

[1] 314

314 up regulated genes.

How many "down" regulated genes do we have?

```
sum(mycounts log 2fc <= -2)
```

[1] 485

485 down regulated genes.

DESeq Analysis

The code in this section essentially does the same thing as the rest of the above code, but obviously with much less work.

We need to determine if the log2fc change is actually significant, we need to see if the data is even relevant.

```
library(DESeq2)
```

To use DESeq we need to get our input data in a very particular format.

converting counts to integer mode

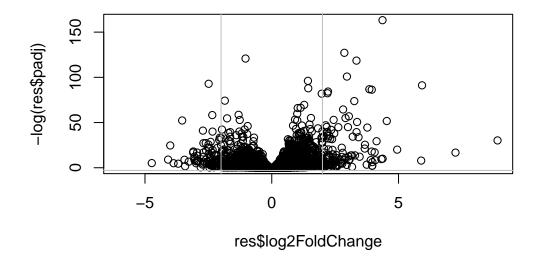

Warning in DESeqDataSet(se, design = design, ignoreRank): some variables in design formula are characters, converting to factors

Run DESeq analysis

```
dds <- DESeq(dds)
estimating size factors
estimating dispersions
gene-wise dispersion estimates
mean-dispersion relationship
final dispersion estimates
fitting model and testing
Get the results
  res <- results(dds)</pre>

ENSG00000000938
                      NΑ
```

I want to make a summary figure to show an overview of all my results. A plot of log2 fold change vs the adjusted p value

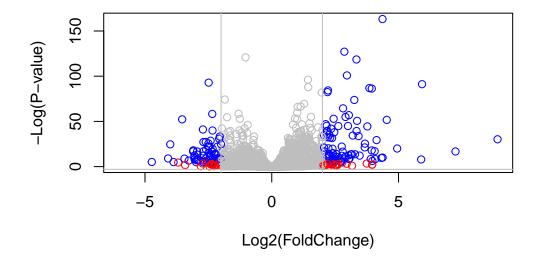

```
plot(res$log2FoldChange, -log(res$padj))
abline(v=-2, col="gray")
abline(v=+2, col="gray")
abline(h=log(0.05), col="gray")
```

Smaller p-values will have a larger negative value when you take the log, so we put the - sign in front to switch it. We care more about the values that are in the left and the right rectangles, these are the ones with the more significant p-values.

To color the genes of interest:

```
abline(v=+2, col="gray")
abline(h=log(0.05), col="gray")
```

Add Annotation Data

We want to add on gene symbols (gene names) as well as other common identifiers from major databases for all our genes of interest.

```
library("AnnotationDbi")
library("org.Hs.eg.db")
```

We can translate between the following IDs:

```
columns(org.Hs.eg.db)

[1] "ACCNUM" "ALIAS" "ENSEMBL" "ENSEMBLPROT" "ENSEMBLTRANS"

[6] "ENTREZID" "ENZYME" "EVIDENCE" "EVIDENCEALL" "GENENAME"
```

We can use the mapIds() function to add individual columns to our results table. We provide the row names of our results table as a key, and specify that keytype=ENSEMBL. The column argument tells the mapIds() function which information we want, and the multiVals argument tells the function what to do if there are multiple possible values for a single input value. Here we ask to just give us back the first one that occurs in the database.

^{&#}x27;select()' returned 1:many mapping between keys and columns

                                  "978"
```

To run gage we need to provide it with a vector of fold-change values (not the whole entire results table)

```
foldchanges <- res$log2FoldChange</pre>
```

We need to add the EntrezIDs as names to this vector

Now we run gage with this input and the KEGG pathways

		p.geomean	stat.mean	p.val	q.val
hsa00232 Caffeine m	etabolism	NA	NaN	NA	NA
hsa00983 Drug metab	olism - other en	zymes NA	NaN	NA	NA
hsa01100 Metabolic	pathways	NA	NaN	NA	NA

hsa04514 Cell adhes	ion molecules (CA	AMs) NA	NaN	NA	NA
		set.size	exp1		
hsa00232 Caffeine m	etabolism	0	NA		
hsa00983 Drug metab	olism - other en	zymes 0	NA		
hsa01100 Metabolic	pathways	0	NA		
hsa00230 Purine met	abolism	0	NA		
hsa05340 Primary im	munodeficiency	0	NA		
hsa04514 Cell adhes	ion molecules (CA	AMs) 0	NA		

Let's have a look at the hsa05310 Asthma pathway with our genes highlighted using the pathview() fucntion:

pathview(gene.data=foldchanges, pathway.id="hsa05310")

Warning: None of the genes or compounds mapped to the pathway! Argument gene.idtype or cpd.idtype may be wrong.

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/juliettebokor/Documents/BIMM143SP24/Class13

Info: Writing image file hsa05310.pathview.png
